

# HYDROMIX

## Scale & Water Spot Sequestering System

### PREVENT HARD WATER STAINS and CORROSION

The Hydromix Scale & Water Spot Sequestering System is specifically formulated to prevent hard water stains, including scale, water spotting and iron staining in commercial, industrial and residential potable water applications. The injected phosphorus forms a protective coating on metal and plastic surfaces preventing hard water stains, scale, corrosion and copper leaching. As a bonus, the Hydromix injection system also protects water pumps, boilers, pipes and fixtures from calcium and hard water scale buildup.

Optional: i5 Metered Control Valve for use with water filtration systems.  
**(When run independently a separate water meter will be supplied).**

To eliminate hard water stains, simply inject Hydromix solution by chemical feed pump into the raw water system as close to the source as possible. **This product is NSF Certified to meet NSF/ANSI Standard 60 for drinking water additives.**
